Open to roles in Spain and across Europe.

PROFESSIONAL SUMMARY

Senior full-stack engineer with 7+ years of experience, including continuous work at EPAM for Vertafore in the insurance domain since 2021. Builds interfaces with React and TypeScript and services with C# and ASP.NET Core. Establishes reusable architecture and migration approaches, equips other teams to continue the work, and configures AI-assisted development with human review.

Selected results at Sagitta: implementation completed in 6 months against an 18-month estimate after my proposed token-management change; CI/CD pipeline speed improved by over 200%; build times reduced from about 40 seconds to 15–18 seconds; redundant UI renders reduced from nine to one.

TECHNICAL SKILLS

Front end: React, TypeScript, JavaScript, HTML, Next.js, Redux Toolkit, TanStack Query (React Query), Formik, Yup, SCSS, CSS Modules

Back end: C#, .NET, ASP.NET Core, REST APIs, Node.js, NestJS, Express, OAuth, JWT, legacy database integration

Cloud and delivery: Amazon Web Services (AWS), GitLab, Git, CI/CD, Vite, Webpack

Testing: Jest, React Testing Library, Playwright, unit, regression and end-to-end testing

AI-assisted engineering: GitHub Copilot, custom agents, multi-agent workflows, reusable prompts, repository instructions, human review gates

Methodologies: Agile, Scrum, Waterfall, code review, mentoring

PROFESSIONAL EXPERIENCE

EPAM Systems | Feb 2021 - Present

Client throughout: Vertafore — insurance software. Moved to each new assignment once the product was stable and the team could carry it forward.

Senior Full-Stack Developer — Sagitta | Jul 2026 - Present

- Returned to accelerate the React migration of a product with more than 1,000 pages, building on the earlier foundation and existing React pages. Completing the migration with the previous approach would have taken years.
- With the team, generalized the Agency One components already adapted for Sagitta, encapsulating application logic as well as UI for reusable forms, grids, bulk actions and API integration.
- Configured GitHub Copilot agents and repository instructions for legacy analysis, design, implementation and review, with build and test checks, human review gates and reports for product owners and developers.
- Combined a stronger shared foundation with AI-assisted development to reduce typical page delivery time, including testing and review, from about a month to between a few days and three weeks, depending on complexity.
- Implemented masked credential reveal and replacement, claims-based permissions and MFA configuration; corrected C# and ASP.NET Core APIs and data mappings, and improved React Query caching and persisted table preferences.
- Added Jest and React Testing Library unit and regression tests for forms, secure fields, grids and bulk actions, preserving legacy business rules.

Senior Full-Stack Developer — Import Tool & Certificates Platform | May 2025 - Jul 2026

- Started with front-end architecture consulting on Import Tool: assessed the design, delivered improvements and a prioritized roadmap, then collaborated with engineers to integrate it with Certificates Platform.
- Owned document generation, download and import handling, and in-app PDF previews, stabilizing failures across the flow. Coordinated AI-assisted Playwright end-to-end test improvements and code reviews across teams.
- Established team ownership of ongoing delivery before returning to Sagitta for the next modernization phase.

Senior Front-End Developer — Agency One | Jan 2024 - May 2025

- Built a reusable component library shared across products and evaluated third-party libraries for maintainability and team needs.
- Created shared top navigation that products integrated with their authentication token, enabling cross-product navigation without another login and carrying customer and policy context. Moved to the next assignment after the product stabilized.

Full-Stack Engineer — Sagitta | Feb 2021 - Jan 2024

- Challenged token management in the ASP business layer that would break refresh and browser navigation. The revised approach took 6 months against an 18-month estimate, saving a year for seven teams while preserving browser behavior.
- Improved CI/CD pipeline speed by over 200%. Separately, reduced build times from about 40 seconds to 15–18 seconds through Webpack and tooling changes.
- Reorganized the frontend architecture and Redux state flows, reducing redundant renders from nine to one, then initiated the React migration.
- Defined the VBScript conversion and React migration approaches for a 30-year-old, IE-only product with 1,000+ pages. Built the first pages, resolved CSS compatibility issues and refreshed the design, establishing patterns that other teams could use to continue the work.
- Shipped API endpoints and hotfixes, contributed to legacy database integration, and improved logging and validation to address cross-layer defects.

Cross-project contribution: Mentored engineers across experience levels, supporting onboarding and stronger code quality.

Independent Software Engineer — Self-employed | Mar 2019 - Feb 2021

Project-based client work

- Delivered React and Node.js applications end to end, including API integrations, authentication and deployment workflows.
- Built responsive marketing and e-commerce sites, including custom WordPress themes and CMS configuration.
- Worked directly with clients to define requirements, prioritize delivery and improve sites after launch, including SEO work.

EDUCATION & PROFESSIONAL DEVELOPMENT

Software Engineering (Bachelor's studies, not completed) — Ivan Franko National University of Lviv | 2020

Senior Engineer Growth Program — EPAM Systems | 2022

LANGUAGES

English — Fluent | German — Proficient | Japanese — Beginner

Working language: English. Written communication in Spanish via chat or email with AI-assisted translation.
